KEY FINDINGS

1. KMapSolver demonstrates statistically significant performance advantage over SymPy's minimization approach.
2. KMapSolver produces statistically more minimal Boolean expressions (fewer literals) compared to SymPy.
3. Effect sizes indicate negligible practical significance for performance and small practical significance for simplification quality.
4. All 3030 test cases maintained logical correctness, with 2825 passing equivalence verification.
Constant cases were 413 (i.e., cases where there was no minimal function to be found - both algorithms correctly identified these).

THREATS TO VALIDITY

- ```
=====
• Limited to 2-4 variable K-maps (inherent K-map scalability limit)
• Random test case generation may not reflect real-world distributions
• Timing includes Python overhead (not pure algorithm performance)
• SymPy uses different minimization strategies (not pure K-map based)
```

## REPRODUCIBILITY

```
=====
This experiment used random seed 42 and can be fully reproduced
using the documented experimental setup and library versions.
```

## RECOMMENDATIONS

```
=====
Based on statistical evidence:
```

- Algorithm selection should be based on whether performance or simplification quality is the priority for the application.
