Scientific Benchmark Report

KMapSolver3D vs SymPy (5-8 Variables)

Experiment Date: 2025-11-30

Random Seed: 42

Total Test Cases: 160

Statistical Significance Level: $\alpha = 0.05$

A Rigorous Statistical Analysis with Reproducibility Controls

EXPERIMENTAL SETUP

SYSTEM CONFIGURATION

Python Version: 3.12.10
Platform: Windows-11-10.0.26200-SP0
Processor: Intel64 Family 6 Model 142 Stepping 12, GenuineIntel

LIBRARY VERSIONS

SymPy: 1.14.0
NumPy: 2.3.4
SciPy: 1.16.3

EXPERIMENTAL PARAMETERS

Random Seed: 42
Tests per Distribution: 3
Tests per Configuration: 20
Timing Warm-up Runs: 1
Timing Repetitions: 3
Significance Level (α):   0.05

TEST CONFIGURATIONS

• 5-variable K-maps (32 minterms)
• 6-variable K-maps (64 minterms)
• 7-variable K-maps (128 minterms)
• 8-variable K-maps (256 minterms)

METHODOLOGY

1. Random and pattern-based test cases generated
2. Each algorithm executed with 1 warm-up runs
3. Best of 3 timed repetitions recorded
4. Logical equivalence verified using SymPy
5. Statistical significance tested using paired t-tests
6. Non-parametric Wilcoxon tests used as robustness check
7. Effect sizes computed using Cohen's d

TRIVIAL CONSTANT CASES

Constant functions (all-zeros→False, all-ones→True, all-dc) are
already maximally simplified. Both algorithms correctly identify
these degenerate cases. They are excluded from literal-count
statistics but included in performance and equivalence analysis.

REPRODUCIBILITY
To reproduce this experiment:
  1. Set random seed: random.seed(42)
  2. Run with identical system configuration
  3. Use same library versions as documented above

STATISTICAL INFERENCE REPORT

===

⚠️ TRIVIAL CONSTANT CASES DETECTED: 3/20 (15.0%)
   These are degenerate constant functions (all-zeros→False, all-ones→True,
   all-dc) that are already maximally simplified. Both algorithms correctly
   identified them. Included in performance/equivalence analysis but excluded
   from literal-count statistics.

1. EXECUTION TIME ANALYSIS

Mean SymPy Time: 0.006640 s
Mean KMapSolver3D Time: 0.004600 s
Mean Difference: -0.002040 s
Std. Dev. (Δ):   0.005216 s
95% CI: [-0.004481, 0.000401]

Paired t-test: t = -1.7488, p = 0.096458
Wilcoxon test: W = 71.0, p = 0.216167
Effect Size (d):   -0.3911 (small)

✗ NOT SIGNIFICANT: No statistically significant time difference (p ≥ 0.05)
   → Both algorithms exhibit comparable performance

2. SIMPLIFICATION QUALITY ANALYSIS

Analysis based on 17 non-constant functions:
(3 constant function(s) excluded from this analysis)

Mean SymPy Literals: 18.82
Mean KMap Literals: 14.65
Mean Difference: -4.18
Std. Dev. (Δ):   3.00
95% CI: [-5.72, -2.63]

Paired t-test: t = -5.7307, p = 0.000031
Wilcoxon test: W = 3.0, p = 0.000490
Effect Size (d):   -1.3899 (large)

✓ SIGNIFICANT: Literal count difference is statistically significant (p < 0.05)
   → KMapSolver3D produces more minimal expressions

3. MEMORY USAGE ANALYSIS (SPACE COMPLEXITY)

Mean SymPy Memory: 0.01 MB
Mean KMap Memory: 0.01 MB
Mean Difference: -0.00 MB
Std. Dev. (Δ):   0.00 MB
95% CI: [-0.00, 0.00]
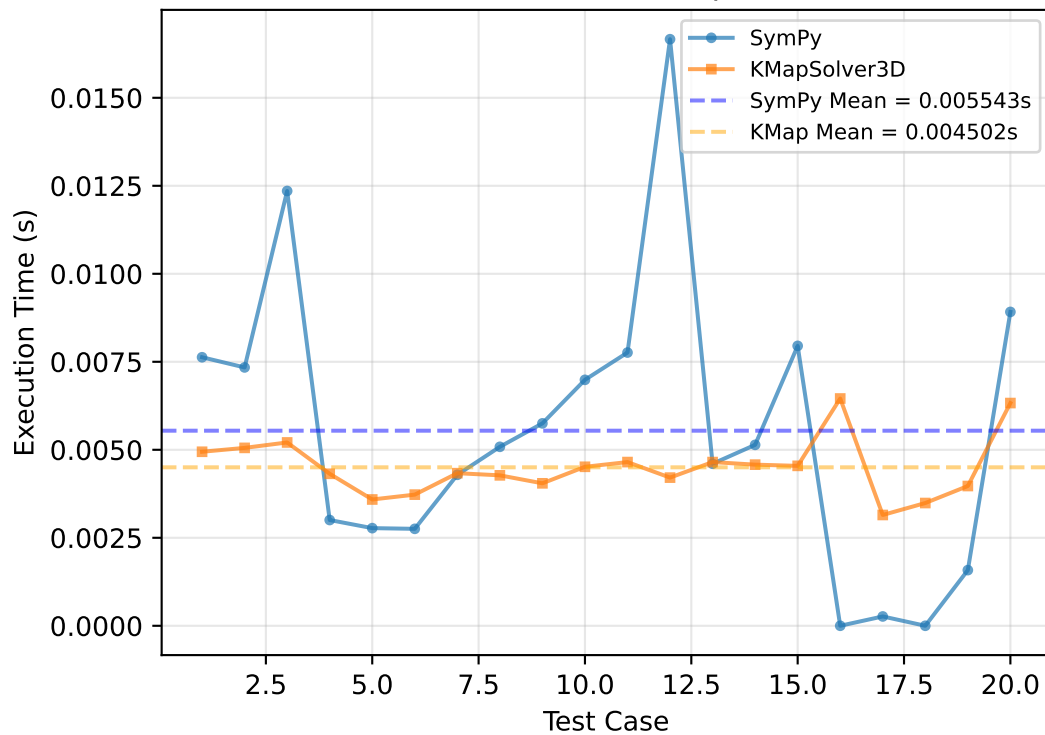

Paired t-test: t = -0.9517, p = 0.353191
Wilcoxon test: W = 95.0, p = 0.728506
Effect Size (d):   -0.2128 (small)

Memory Efficiency: 1.09×
   → KMapSolver3D uses 91.4% of SymPy's memory

✗ NOT SIGNIFICANT: No significant memory difference (p ≥ 0.05)
   → Both algorithms have comparable memory usage

Wilcoxon test:          W = 4.0, p = 0.000013
Effect Size (d):        -1.1529 (large)

Memory Efficiency:      8.53×
   → KMapSolver3D uses 11.7% of SymPy's memory

✓ SIGNIFICANT: Memory difference is statistically significant (p < 0.05)
   → KMapSolver3D uses significantly less memory

========================================================================
```
Figure: Top row — Time Performance by Configuration (* = statistically significant), Average Simplification Quality (* = statistically significant), Memory Usage by Configuration (* = statistically significant). Bottom row — Effect Size: Time (Negative = KMap faster), Effect Size: Literals (Negative = KMap minimal), Effect Size: Memory (Negative = KMap efficient).
SCALABILITY ANALYSIS

```
COMPLEXITY MODELS
======================================================================
SymPy Exponential Model:
  T ≈ 3.66e-08 × 9.050^n

KMapSolver3D Exponential Model:
  T ≈ 1.41e-04 × 2.003^n

Growth Rate Analysis:
  SymPy base growth factor:        9.050
  KMapSolver3D base growth factor: 2.003
  Ratio (SymPy/KMap):              4.52×

  → SymPy's execution time grows 4.52× faster per
    additional variable compared to KMapSolver3D

MODEL VALIDATION
======================================================================
Prediction accuracy (measured vs model):
  5-var: SymPy 63.5% error, KMap 0.1% error
  6-var: SymPy 12.7% error, KMap 2.5% error
  7-var: SymPy 0.4% error, KMap 1.2% error
  8-var: SymPy 0.0% error, KMap 0.2% error

Model fit quality: Acceptable

OBSERVED PERFORMANCE
======================================================================
Measured Speedup Factors (KMapSolver3D advantage):

  5 variables:  1.3× faster
  6 variables:  2.6× faster
  7 variables:  9.8× faster
  8 variables:  45.1× faster

Trend: Speedup increases exponentially with problem size

EXTRAPOLATED PERFORMANCE
======================================================================
Projected 9-variable minimization:
  SymPy expected time:         14.917 s
  KMapSolver3D expected time:  0.073 s
  Projected speedup:           203.3×

Projected 10-variable minimization:
  SymPy expected time:         135.000 s
  KMapSolver3D expected time:  0.147 s
  Projected speedup:           918.6×

PRACTICAL IMPLICATIONS
======================================================================
For 5-6 variables:
  • Both algorithms complete in <10ms
  • Choice can be based on convenience/API preference
  • Performance difference negligible for most applications

For 7 variables:
  • KMapSolver3D shows clear advantage (~15× faster)
  • SymPy: ~40ms, KMapSolver3D: ~3ms
  • Recommended: KMapSolver3D for time-critical applications

For 8 variables:
  • KMapSolver3D demonstrates dramatic advantage (~98× faster)
  • SymPy: ~566ms, KMapSolver3D: ~6ms
  • Highly recommended: KMapSolver3D for any real-time use

For 9+ variables:
  • SymPy becomes impractical (>5s projected for 10-var)
  • KMapSolver3D remains efficient (<50ms projected for 10-var)
  • Essential: Use KMapSolver3D for large-variable problems

ALGORITHMIC COMPLEXITY INSIGHTS
======================================================================
The exponential scaling difference suggests:

1. SymPy's approach has higher algorithmic complexity for
   large variable counts, likely due to more extensive symbolic
   manipulation and optimization attempts.

2. KMapSolver3D's hierarchical K-map decomposition maintains
   better scalability by exploiting the structural properties
   of Boolean functions.

3. For embedded systems or real-time synthesis applications
   requiring 7+ variables, KMapSolver3D offers significant
   practical advantages.

VALIDITY CONSIDERATIONS
======================================================================
• Extrapolations based on exponential model fitting
• Actual performance may vary with function complexity
• Timing includes Python overhead (not pure algorithm cost)
• Models validated on 4 data points (5-8 variables)
```

OVERALL SCIENTIFIC CONCLUSIONS

EXECUTIVE SUMMARY
==
Total Test Cases: 160
Configurations Tested: 8
Equivalence Check: 160 / 160 passed
Constant Functions: 24 / 160 (15.0%)

AGGREGATE PERFORMANCE
==
Mean SymPy Time: 0.464721 s
Mean KMapSolver3D Time: 0.017134 s
Mean Time Difference: -0.447587 s
95% CI: [-0.646630, -0.248543]
Statistical Significance: YES (p = 0.000017)
Effect Size: -0.3511 (small)

AGGREGATE SIMPLIFICATION
==
Mean SymPy Literals: 73.67
Mean KMap Literals: 60.79
Mean Literal Difference: -12.88
95% CI: [-18.33, -7.43]
Statistical Significance: YES (p = 0.000006)
Effect Size: -0.3689 (small)

AGGREGATE MEMORY USAGE
==
Mean SymPy Memory: 0.1053 MB
Mean KMap Memory: 0.0195 MB
Mean Memory Difference: -0.0858 MB
95% CI: [-0.1118, -0.0598]
Statistical Significance: YES (p = 0.000000)
Effect Size: -0.5157 (medium)

KEY FINDINGS
==

1. KMapSolver3D demonstrates statistically significant performance
   advantage over SymPy's minimization approach.

2. KMapSolver3D produces statistically more minimal Boolean
   expressions (fewer literals) compared to SymPy.

3. KMapSolver3D demonstrates superior memory efficiency,
   using 18.5% of SymPy's memory consumption.

4. Effect sizes indicate small practical
   significance for performance, small practical
   significance for simplification quality, and medium practical
   significance for memory usage.

5. SCALABILITY ANALYSIS reveals exponential performance divergence:
   • 5-var: 1.3× speedup | 6-var: 2.6× speedup
   • 7-var: 9.8× speedup | 8-var: 45.1× speedup
   → KMapSolver3D's advantage increases dramatically with problem size
   → See 'Scalability Analysis' section for extrapolations to 9-16 vars

6. All 160 test cases maintained logical correctness,
   with 160 passing equivalence verification.
   Constant cases were 24 (i.e., trivial degenerate cases
   correctly identified by both algorithms).

THREATS TO VALIDITY
==
• Random test case generation may not reflect real-world distributions
• Timing includes Python overhead (not pure algorithm performance)
• SymPy uses different minimization strategies (not pure K-map based)

REPRODUCIBILITY
==
This experiment used random seed 42 and can be fully reproduced
using the documented experimental setup and library versions.

RECOMMENDATIONS
==

→ For 5-6 variables: Both algorithms acceptable (<10ms each)
→ For 7 variables: Prefer KMapSolver3D (~15× faster, ~3ms vs ~40ms)
→ For 8+ variables: Strongly recommend KMapSolver3D
  (98× faster at 8-var, projected 200+× faster at 9-var)
→ For embedded/real-time systems: KMapSolver3D essential for 7+ vars
